

DUO system

EN 795/C

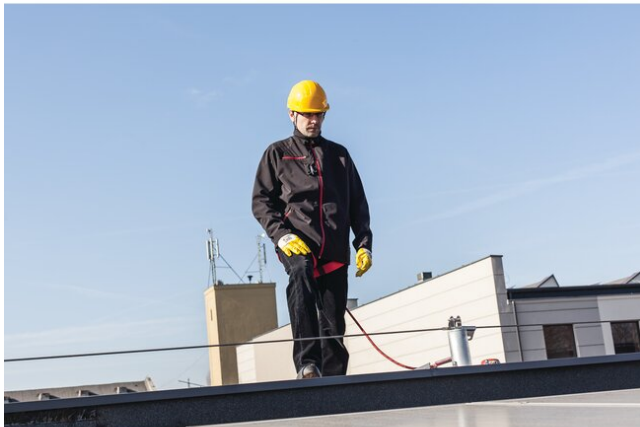

The DUO rope anchoring system is a C-type anchor device, compliant with EN 795. It is designed for simultaneous use by 1, 2 or 3 people, with the possibility of reconfiguration for 7 people. The system can be installed on the walls of buildings, steel structures and on roofs or terraces. Every user is attached to an individual slider which constitutes a mobile anchoring point for individual equipment and enables free movement along the system without losing protection.

The system consists of the following components:

- end structural fasteners such as wall plates or posts,
- intermediate structural fasteners such as rope holders or bends,
- shock absorbers of the rope tensioning elements,
- rope connecting elements which constitute guides for movable anchoring points for individual protective equipment.
